FOREWORD

Through the process of normal evolution, it is expected that expansion, deletion, or modification of this document may occur. This Report is therefore subject to CCSDS document management and change control procedures, which are defined in the *Procedures Manual for the Consultative Committee for Space Data Systems*. Current versions of CCSDS documents are maintained at the CCSDS Web site:

<http://www.ccsds.org/>

Questions relating to the contents or status of this document should be addressed to the CCSDS Secretariat at the address indicated on page i.

At time of publication, the active Member and Observer Agencies of the CCSDS were:

Member Agencies

- Agenzia Spaziale Italiana (ASI)/Italy.
- British National Space Centre (BNSC)/United Kingdom.
- Canadian Space Agency (CSA)/Canada.
- Centre National d'Etudes Spatiales (CNES)/France.
- Deutsches Zentrum für Luft- und Raumfahrt e.V. (DLR)/Germany.
- European Space Agency (ESA)/Europe.
- Federal Space Agency (Roskosmos)/Russian Federation.
- Instituto Nacional de Pesquisas Espaciais (INPE)/Brazil.
- Japan Aerospace Exploration Agency (JAXA)/Japan.
- National Aeronautics and Space Administration (NASA)/USA.

Observer Agencies

- Austrian Space Agency (ASA)/Austria.
- Belgian Federal Science Policy Office (BFSPO)/Belgium.
- Central Research Institute of Machine Building (TsNIIMash)/Russian Federation.
- Centro Tecnico Aeroespacial (CTA)/Brazil.
- Chinese Academy of Space Technology (CAST)/China.
- Commonwealth Scientific and Industrial Research Organization (CSIRO)/Australia.
- Danish Space Research Institute (DSRI)/Denmark.
- European Organization for the Exploitation of Meteorological Satellites (EUMETSAT)/Europe.
- European Telecommunications Satellite Organization (EUTELSAT)/Europe.
- Hellenic National Space Committee (HNSC)/Greece.
- Indian Space Research Organization (ISRO)/India.
- Institute of Space Research (IKI)/Russian Federation.
- KFKI Research Institute for Particle & Nuclear Physics (KFKI)/Hungary.
- Korea Aerospace Research Institute (KARI)/Korea.
- MIKOMTEK: CSIR (CSIR)/Republic of South Africa.
- Ministry of Communications (MOC)/Israel.
- National Institute of Information and Communications Technology (NICT)/Japan.
- National Oceanic & Atmospheric Administration (NOAA)/USA.
- National Space Organization (NSPO)/Taipei.
- Space and Upper Atmosphere Research Commission (SUPARCO)/Pakistan.
- Swedish Space Corporation (SSC)/Sweden.
- United States Geological Survey (USGS)/USA.

1 INTRODUCTION

1.1 PURPOSE AND SCOPE

The CCSDS has developed the XML Formatted Data Unit (XFDU) for the packaging of data and metadata, including software, into a single package (e.g. file or message) to facilitate information transfer and archiving. The scope of application of XFDU is the entire space informatics domain from operational messaging to interfacing with science archives.

To support the development of the structure and construction rules of XFDU in the CCSDS international and cross-supporting environment, an international interoperability test was organized and successfully executed. This test program involved three implementations of the XFDU specifications developed by ESA, NASA and CNES. All implementations have been used for generating XFDU packages that have been exchanged to validate both their coverage of the specifications and their interoperability. This paper is a final report on the process of testing, the test results.

2 THE XML FORMATTED DATA UNIT

A high level view of the XFDU is shown in Figure 2-1. It consists of an interchange file, called the Package Interchange File, that contains an XML structured Manifest Document and possibly other files. However it also logically includes other external objects (typically files) pointed to from within the Manifest Document. The Package Interchange File may also be an XML file, or it may be some type of binary file archive format such as ZIP or JAR.

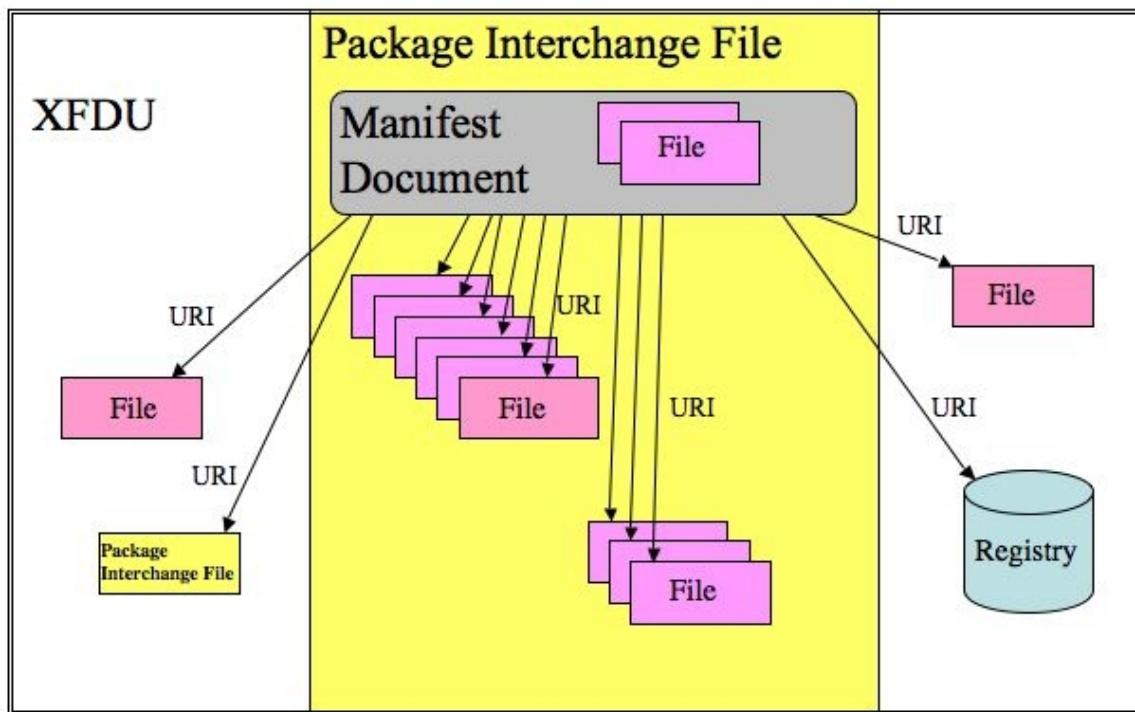

Figure 2-1: An XFDU as a Package interchange File

An XFDU consists of a interchange file containing a Manifest Document and possibly other files, but logically includes other external objects (files) pointed to from the Manifest Document.

The Manifest Document has a few major components whose functions and relationships are shown in the following Figure

The Manifest includes a mandatory structure map section, called an Information Package Map (which may be repeated) that defines one or more Content Units. The Manifest Document has a few major components whose functions and relationships are shown in Figure 2-2. It includes a mandatory structure map section, called Information Package Map (which may be repeated) that defines one or more Content Units.

A Content Unit may contain other Content Units, and each Content Unit has a number of other optional attributes and elements. Its attributes allow reference to associated Metadata Objects by internal pointers to elements in the Metadata Object section. Therefore a Content Unit can be used to associate a Data Object with one or more Metadata Objects, and multiple Content Units can present a hierarchical view of these data/metadata associations.

The attributes of a Data Object in the Data Object section are used to provide information such as mime type, size in bytes, checksum value and type, an internal pointer to associated Representation Information, and an identifier for information registered with a given registration authority. The elements describing a Data Object enable the object to be described as a sequence of one or more byte streams. The location of each byte stream is given either by a pointer (e.g., URL), or it may be included as Base64 octet sequence. Note that each byte stream also has a set of attributes that can be used to provide mime type, size in bytes, checksum value and type. Further, each byte stream may have an associated transformation element giving the type of transformation that has been applied to the byte stream in its current state.

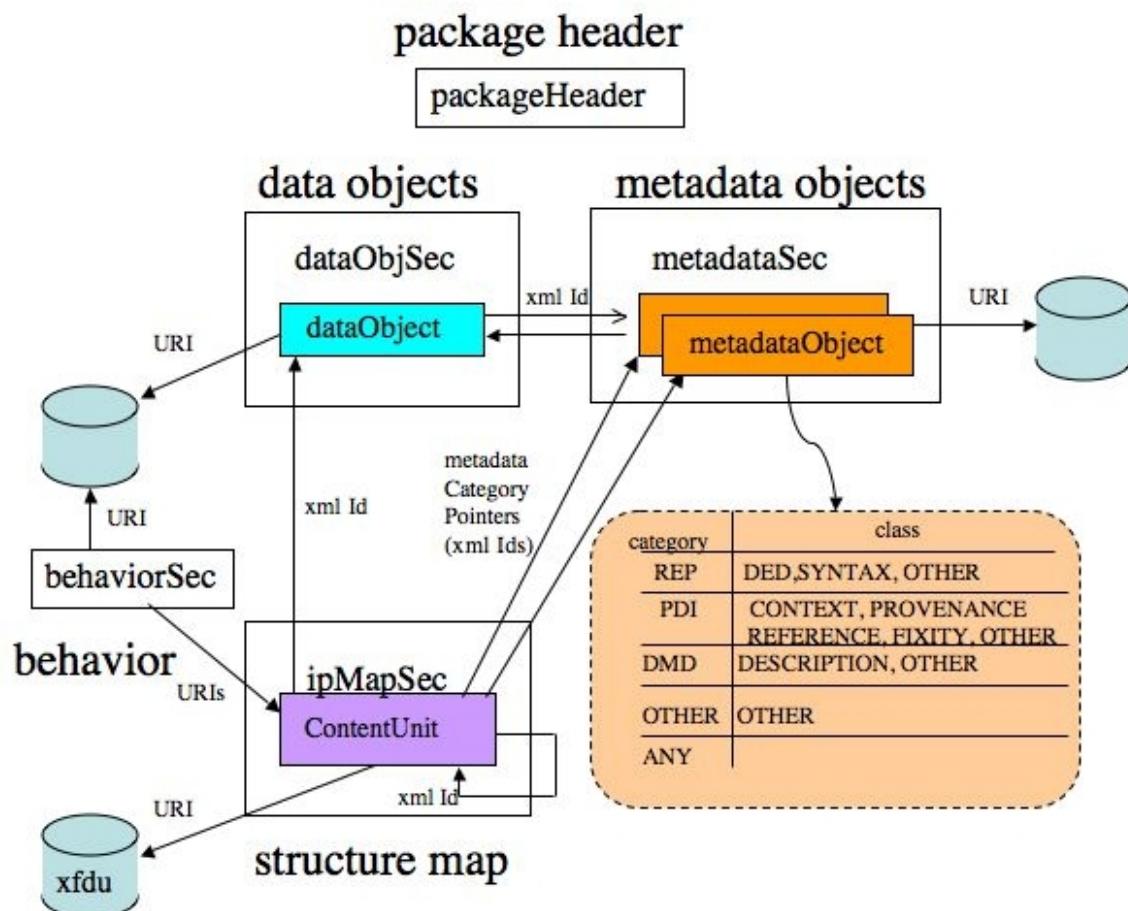

Figure 2-2: XFDU Manifest Document

In the Metadata Object section, the attributes of a Metadata Object, like those of a Content Unit, can be used to categorize and classify the objects, including the ability to distinguish among Representation Information, Preservation Description Information (PDI), and Descriptive Information as shown in Figure 2-2. The elements describing Metadata Objects are used to either encapsulate the actual object in base64, or to point to a Data Object in the Data Object section. This allows a Metadata Object to also be described as Data Object in the Data Objects section.

A Behavior Section contains one or more Behavior Objects (*behaviorObject*) that associate executable behaviors with content in the XFDU object. A Behavior Object contains an Interface Definition (*interfaceDef*) that represents an abstract definition of the set of behaviors represented by a particular Behavior Object.

A Package Header contains administrative metadata for the whole XFDU Package, such as version, operating system, hardware, author, etc, and it may contain metadata versions/extensions that must be understood to successfully process the contents of the XFDU. An example of this metadata is a reference to an implementation of an algorithm to reverse a transformation that has been applied to some of the data objects within the containing XFDU

3 IMPLEMENTATIONS IDENTIFICATION

Whether for operational, experimental or specification support purposes, ESA, NASA and CNES have developed and updated three implementations of the XFDU. Among those, the NASA implementing software is independent from the others. The ESA and CNES implementations are based on the same platform but address different areas of the XFDU structure and construction rules. A general description of all these implementations is provided in the remaining sections of the present chapter.

3.1 ESA IMPLEMENTATION

The ESA implementation, called Standard Archive Format for Europe (SAFE) was developed not only for prototyping and validating XFDU concepts but also to become an operational material contemporaneously with the first official issue of the XFDU Blue Book [1]. SAFE is a file format standard that conforms to the XFDU construction rules and adapts it to Earth Observation products. SAFE is a suite of components including:

- A *SAFE Core Control Book* [2] governing the specialization of XFDU structure and construction rules that all SAFE packages shall conform to;
- A *Recommendation for Specializing SAFE Core Control Book* [3] that describes a series of methods and rules that should be used by specialization builders;
- A set of 19 *SAFE Specialized Control Books* that specializes the *SAFE Core Control Book* described above to more than a hundred of product types originating for various Earth Observation spacecrafsts and sensors e.g. Landsat series, ALOS, ENVISAT, ERS 1-2, MODIS, NOAA, SPOT, etc.
- A *SAFE I/O Java API* [2] which proposes a Java interface for reading and writing XFDU/SAFE products. The SAFE I/O Java API implements a subset of the XFDU structure and construction rules: the feature coverage of the implementation can be deduced from the left columns of the Interoperability Test Matrix provided in Chapter 5.
- A *SAFE C++ I/O API* [2] which wraps around the SAFE Java API described above, for integration with C++ or native systems.
- *SAFE Transform* software component that is dedicated to the conversion of product from some legacy formats to SAFE, and consequently to XFDU.

The SAFE suite is a free material that can be downloaded from the official ESA Web site <<http://earth.esa.int/safe>>. Source code of software components are currently not made available.

The interoperability tests performed with the SAFE software components are reported in ANNEX A and summarized in chapter 5 below.

3.2 NASA IMPLEMENTATION

The NASA implementation, called XFDU Toolkit, was developed as a reference implementation for XFDU standard. The XFDU Toolkit is a library implementing set of APIs for XFDU manipulation. XFDU API Library conceptually consists of two layers. The first (core) layer is low level API representing each structure in XFDU schema. The second layer is more high level API. It aggregates parts of functionality from the first layer; thus, allowing easier access to constructing and manipulating an XFDU package. The toolkit is implemented in JAVA programming language. The core layer is generated directly from XFDU XML schema using Java API for XML Binding (JAXB). The toolkit implements majority of XFDU defined functionality except dealing with behaviors. The XFDU Toolkit requires java 5+ to operate. The XFDU Toolkit and accompanying documentation are available at <<http://sindbad.gsfc.nasa.gov/xfdup>>. To download binary and source distribution special login is required and authorized by NASA.

The interoperability tests performed with the NASA software components are reported in ANNEX B and summarized in chapter 5 below.

3.3 CNES IMPLEMENTATION

CNES contributed to the implementation effort by upgrading the ESA software to experiment Behavior Objects that was not covered and by augmenting it with a graphical user interface. This activity lead to a desktop application named “XFDU View” [7] and for which the main interface is illustrated in the figure below.

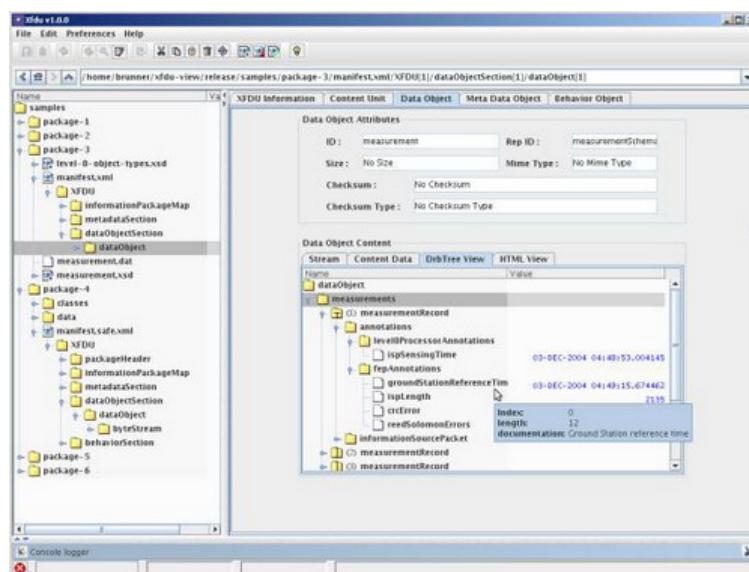

Figure 3-1: XFDU View Main Interface

CCSDS REPORT CONCERNING XFDU INTEROPERABILITY TESTING

The XFDU View and accompanying material is free and can be downloaded from <<http://www.gael.fr/xfdu>>. The source code of the software is not available. Source code of software components are currently not made available.

The interoperability tests performed with the CNES XFDU Viewer software components are reported in ANNEX C and summarized in chapter 5 below.

4 INTEROPERABILITY TEST DEFINITION

The interoperability test activity was driven by the process summarized in the following diagram.

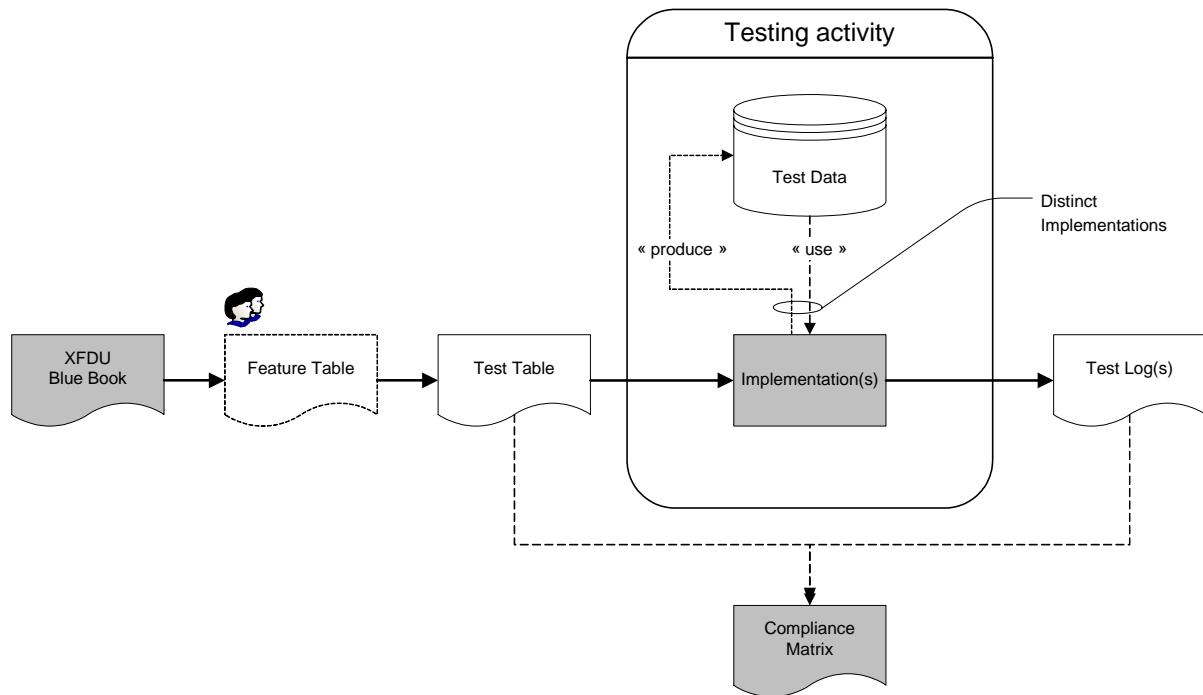

Figure 4-1: Interoperability Testing Process

A first activity conducted during the CCSDS MOIMS meeting held in Heppenheim, Germany was to identify a set of features that should be verified during the interoperability testing. During the same meeting, the resulting feature table led to a set of tests that are summarized in the following table.

It was also decided to use existing XFDU instances based on actual products rather than create artificial test data.

Test Name	Description
Input/Output	
1. Read XML file	The test consists in opening an XFDU Package conforming to [1] from a path locating its Manifest file on the local file system. The test is considered successful if the implementation does not fail, claim to have recognized an XFDU Package and provides pieces of values extracted from the Manifest e.g.

Test Name	Description
	structure of the information package map section, list of metadata objects, etc.
2. Write XML file	The test consists in writing an XFDU Package on the local file system. The test is considered successful if the resulting XFDU Manifest is well-formed and valid according to the reference XFDU XML Schema [1].
3. Read ZIP file	The test consists in opening an XFDU Package conforming to [1] in which XFDU Manifest and accompanying components have been bundled in a ZIP archive. The test does not constraint the means to specify the location of the package e.g. it may be designated by the location of the ZIP file or by a virtual XPath that references the Manifest file within this package. The test is considered successful if the implementation does not fail, claim to have recognized an XFDU Package and provides pieces of values extracted from the Manifest e.g. structure of the information package map section, list of metadata objects, etc.
4. Write ZIP file	The test consists in writing an XFDU Package with its Manifest and accompanying Components bundled in a ZIP file. The test is considered successful if (optionally extracted from the archive) the resulting XFDU Manifest is well-formed and valid according to the reference XFDU XML Schema [1].
Package Header	
5. specificationVersion check	The test consists in accessing the Package Header of a Manifest document and in verifying the version number. The test is considered successful if the version has been successfully retrieved and displayed.
6. sequenceInformation check	The test consists in accessing the package sequence number from the Package Header of a Manifest document. The test is considered successful if the sequence information has been successfully retrieved and displayed.
Information Package Map	
7. contentUnits tree check	The test consists in reading and interpreting the overall Content Units contained in the information package map section of an XFDU package. The test is considered successful if the overall Content Units are

Test Name	Description
	read and displayed, reporting in particular the nesting levels of the units.
Metadata Section	
8. metadata reference access	The test consists in reading and interpreting a Metadata Object that have a URL reference to an external component. The test is considered successful if the reference could be read and displayed. The fact that implemented software supports opening the referenced file is not part of the testing.
9. metadata wrapped	The test consists in reading and interpreting a Metadata Object that have XML wrapped content. The test is considered successful if the content could be read and displayed. The fact that implemented software is being able to interpret the wrapped content is not part of the testing.
Data Object Section	
10. Size check	The test consists in verifying the @size attribute of the Data Objects. The test is considered successful if the implementation was able to read the size, compute the actual size of the wrapped of referenced content and compare the two values.
11. Data object reference access	The test consists in reading and interpreting a Data Object that have a URL reference to an external component. The test is considered successful if the reference could be read and displayed. The fact that implemented software supports opening the referenced file is not part of the testing.
12. Data object wrapped	The test consists in reading and interpreting a Data Object that have XML wrapped content. The test is considered successful if the content could be read and displayed. The fact that implemented software is being able to interpret the wrapped content is not part of the testing.
13. Checksum check	The test consists in verifying the checksum attribute of the Data Objects. The test is considered successful if the implementation was able to read the checksum, compute the actual size of the wrapped of referenced content and compare the two values.
14. Namespace extension	The test consists in verifying that the implementation supports XFDU packages that include elements

Test Name	Description
	defined in separate namespaces. The test is considered successful if the implementation does not fail while reading these packages even if it is not able to handle the externally defined elements.

Table 4-1: Test Table Summary

The results of these tests are discussed further in Section 5.1.

5 TEST ACTIVITIES

5.1 PHASE 1 TESTING

The initial phase of testing consisted of exchanging existing instances of XFDU's that were created for internal agency testing (NASA and CNES) or ESA SAFE XFDU's that described actual data products stored in ESA Earth Observation product Archive (MMFI). These datasets were intended to cover the features and operations described in Section 4. The truncated XFDU Manifests and individual test results can be found in ANNEX A to ANNEX C. The annexes are organized by the Agency that produced the test products. The sections within the annexes are organized by the test product and the first two subsections describing the test XFDU and the following subsections stating the test results by Agency.

The first phase of testing began on 12-Oct-2007 during a CCSDS MOIMS Technical Meeting. Several iterations of the tests were required to resolve the use of different versions of the XFDU Schema at the time of the XFDU production and the need to update the XFDU schemas to the final Blue Book specification. A draft test report was developed by the ESA editor and discussed during several telecons during late December 2007.

The review of the Test Report indicated the need to perform tests with error conditions to better illustrate the interoperability of the validation mechanisms between the implementations.

5.2 PHASE 2 TESTING

The Phase 2 testing was focused on the ESA and NASA implementations in the period from 27-December-2007 to 7-January-2008. The major area that required retesting to prove the interoperability criteria stated in Section was the Package Header due to the fact that the ESA implementations did not use the optional Package Header component so the SAFE reports used as test report output did not indicate the success or failure of validating that area.

Other intentional errors included in the XFDU test instance were included to insure that errors were reported in key areas.

The following tests were re-run with the introduction of intentional errors:

- Package header
 - specificationVersion check
 - sequenceInformation check
- Information Package Map
 - contentUnits tree check - incorrect
- Data Object
 - Checksum check
- Namespace Extension check
 - Additional test of reconstituting manifests

CCSDS REPORT CONCERNING XFDU INTEROPERABILITY TESTING

The results of these tests are presented in Annex D of the XFDUI interoperability Report. The review of these tests found that they did better illustrate the interoperability in these areas and the interoperability testing was completed.

The results of these tests are presented in ANNEX D. The review of these tests found that they did better illustrate the interoperability in these areas and the interoperability testing was completed.

6 INTEROPERABILITY TEST MATRIX

A check (✓) in the implemented columns indicates that the agency implementation supports the operation defined by the row. An "✗" in the implemented columns indicates that the agency implementation does not support the operation defined by the row. A check (✓) in the interoperability columns indicates that the functionality required for interoperability of the operation was proven for the agency pair specified in the column heading. A question mark (?) in the interoperability columns indicates that the functionality required for interoperability of the operation could not be proven due to Agency decisions not to implement optional XFDU functionality.

CCSDS REPORT CONCERNING XFDU INTEROPERABILITY TESTING

Functionality/Test	Implemented			Interoperability						Comments
	ESA	NASA	CNES	NASA → ESA	NASA → CNES	ESA → NASA	ESA → CNES	CNES → ESA	CNES → NASA

CCSDS REPORT CONCERNING XFDU INTEROPERABILITY TESTING

Table 6-1: Interoperability Test Matrix

7 SUMMARY OF OBSERVATIONS

This section summarizes several observations that occurred during the test period. The detailed reports of each test are presented in ANNEX A to ANNEX D.

1. The only source of “interoperability errors” was the incorrect schemas in the initial testcases. The errors were due to the fact that the schema versions were from different stages of the XFDU specification lifecycle. Example instances that demonstrate the errors due to inconsistent schemas are shown in Annex E. These problems reinforce the need for an XML Schema Registry and Repository.
2. When the final XFDU Blue Book schema was used in the production and parsing of the test instance there were no errors in the parsing of XFDU's produced by alternate API's.
3. The use of the SAFE tools in the ESA tests was extremely enlightening:
 - a. The validation reports were very mature and provide an excellent example of translating from complex XML instances to a human readable and understandable form.
 - b. The validation reports and the SAFE APIs were oriented towards SAFE products so they were awkward for XFDU features not used in SAFE such as the packageHeader.
 - c. However, the SAFE validator was easily updated to the newest XFDU schema and provided the needed levels of structural interoperability. Also the SAFE parsing did not crash or report any errors on encountering unknown namespaces.
 - d. The “redefine” specialization done by SAFE were effective in that all SAFE instances parsed as valid XFDU's without the SAFE schema being available.
4. The use of “extensionTypes” to allow external bodies to extend the XFDU Schema seems effective since it did not cause any problems in the Interoperability Testing.

ANNEX A**ESA SW OUTPUTS - AGENCIES TEST REPORTS****A1 SAFE ENVISAT MERIS Level 1 Full Resolution Product**

The following product has been generated by the SAFE Transform software (*safe-transform-1.0-patch-6*) part of the SAFE Java/C++ API distribution suite [4], from an ESA product of measures acquired by MERIS sensor onboard ENVISAT spacecraft, on 2004-12-07.

A1.1 Package Layout

Although the XFDU Manifest file references several Components, the package provided to NASA and CNES was constituted by this Manifest only.

A1.2 Manifest File (Abstract)

This report shows that, ESA implementation was reentrant for this package.

A1.4 NASA Interoperability Test Report

The NASA software was able to parse the files, reconstruct the manifest elements as Java objects and rewrite the manifest to the disk.

A1.5 CNES Interoperability Test Report

The following figure reports that XFDU View was able to ingest the XFDU package and interpret its content. Here, the left tree shows the “platform” metadata Object and the right panel, some information extracted from this object.

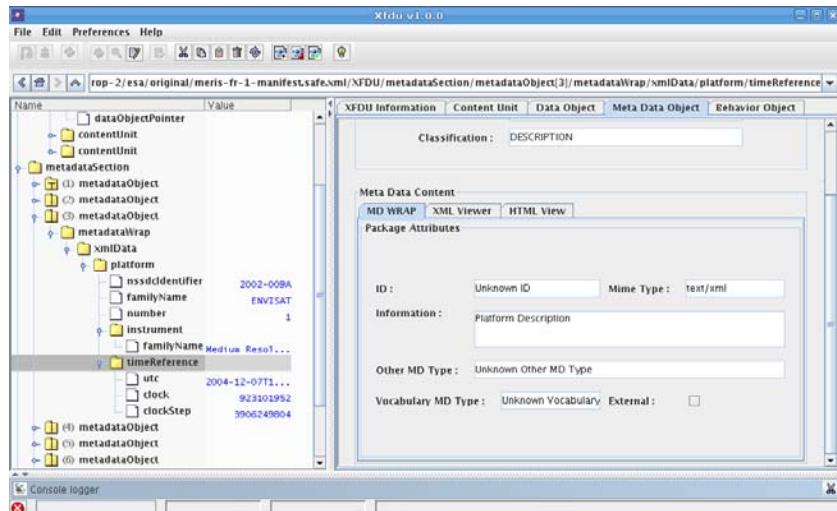

Figure A-1: XFDU View of the SAFE/MERIS package

A2 SAFE AATSR MERIS Level 0 Product

The following product has been generated by the SAFE Transform software (*safe-transform-1.0-patch-6*) part of the SAFE Java/C++ API distribution suite, from an ESA product of measures acquired by AATSR sensor onboard ENVISAT spacecraft on 2004-12-07.

A2.1 Package Layout

Although the XFDU Manifest file references several Components, the package provided to NASA and CNES was constituted by this Manifest only.

A2.2 Manifest File (Abstract)

The following sample has been voluntarily truncated to reduce the page number.

B1.3 ESA Interoperability Test Report

This report shows that ESA Implementation successfully browsed the Manifest file i.e. without failure, and demonstrates the interoperability of the XFDU concepts: goals of the testing activity. However, some errors emerged from the XML Schema validation phase but those could easily be fixed in the implementation by referencing the latest XFDU XML Schema. The final report generated as the following:

[INFO ] The input package is valid.
```

This final test report shows that the package could successfully be loaded, interpreted and validated.

B1.4 CNES Interoperability Test Report

The following figure reports that XFDU View was able to ingest the XFDU package and interpret its content. Here, the left tree shows the Content Units and the right panel, some information extracted from the Information Package Map.

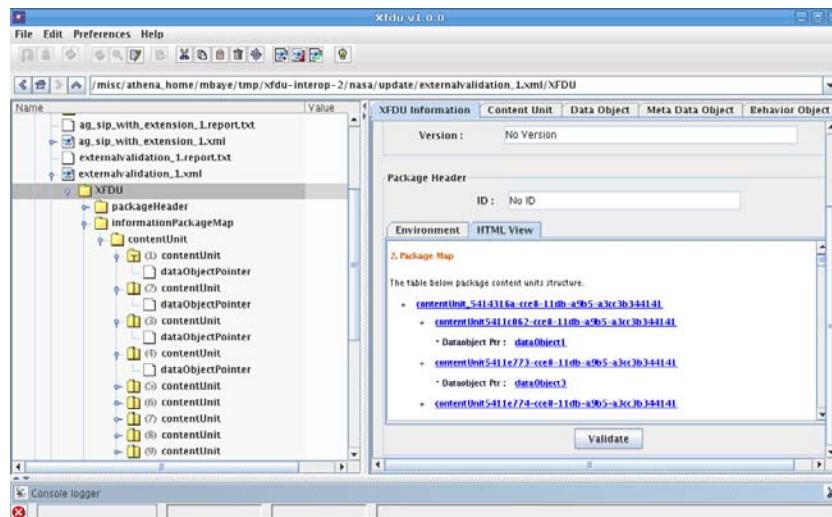

Figure B-1: XFDU View of the SAFE/AATSR package

B2 SIP With Extensions Package

The following XFDU package has been generated by NASA for verifying the concept of <extension/> and externally <anyAttribute/> introduced in the latest version of the XFDU structure and construction rules document. The manifest illustrates these mechanisms as a Submission information package (SIP) currently under specification of the CCSDS MOIMS Data Archive and Ingestion working group.

B2.1 Package Layout

Although the XFDU Manifest file references several Components, the package provided to ESA and CNES was constituted by this Manifest only. The Manifest declares a large set of nested Content Units, one Metadata Object and a large number of Data Objects. This file was accompanied with an XML Schema controlling the non XFDU markups and attributes used in the Manifest i.e. defined and referenced with a SIP dedicated namespace.

B2.2 Manifest File (Abstract)

The following sample has been voluntarily truncated to reduce the page number.

```

<?xml version="1.0" encoding="UTF-8"?>

B2.3 ESA Interoperability Test Report

The package has been submitted to the ESA implementation further a mirror change of namespace. Actually, the submitted package was also referencing the <http://www.ccsds.org/xfdu/2004> namespace that is considered obsolete by the ESA implementation and that, in the last version of the software, is used to segregating former or progress XFDU construction rules from the recommended ones in the XFDU Blue Book. Finally, the document was referencing SIP XML Schema at a specific location that was not available in the ESA context. One all these minor elements fixed, the following report has been produced.

This report shows that ESA Implementation successfully browsed the Manifest file i.e. without failure, and demonstrates the interoperability of the XFDU concepts: goals of the testing activity.

B2.4 CNES Interoperability Test Report

The following figure reports that XFDU View was able to ingest the XFDU package and interpret its content. Here, the left tree shows the “extension” entries that demonstrate the ability to handle these elements without failing.

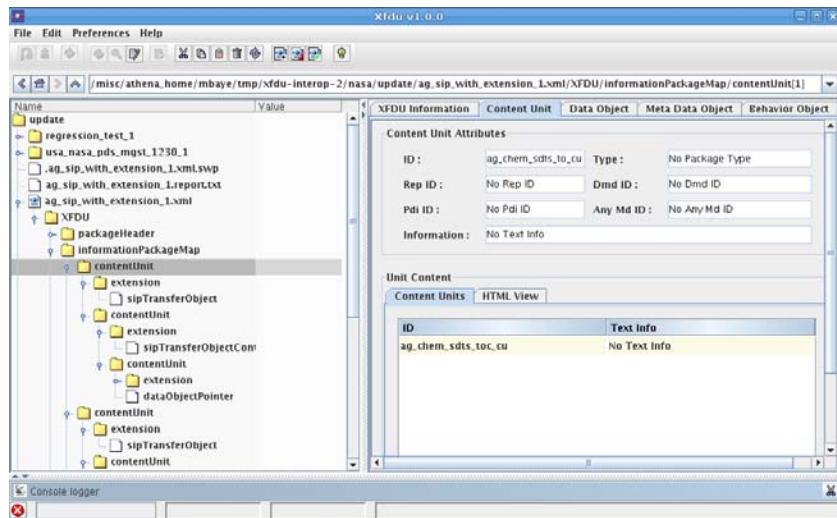

Figure B-2: XFDU View of the SIP/Extension package

B3 XFDU Regression Test Package

The following XFDU zipped package has been generated by NASA as part of a regression testing from SDFU packaging format.

B3.1 Package Layout

The package is a ZIP file including the XFDU Manifest file and a referenced Component. The Manifest is a very simple package that declares one Content Unit, one Metadata Object and one Data Object, all these object referencing the same file.

B3.2 Manifest File (Abstract)

The following sample has been voluntarily truncated to reduce the page number.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<xfdub:XFDU xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="urn:ccsds:schema:xfdu:1 file:/home/sergey/jbproject/xfdu.
  jxb2/schema/xfdu.xsd"
  xmlns:ns3="urn:ccsds:schema:xfdu:1"
  xmlns:xfdu="urn:ccsds:schema:xfdu:1">

B3.3 ESA Interoperability Test Report

The package has been submitted to the ESA implementation further a mirror change of namespace. Actually, the submitted package was also referencing the <http://www.ccsds.org/xfdu/2004> namespace that is considered obsolete by the ESA implementation and that, in the last version of the software, is used to segregating former or progress XFDU construction rules from the recommended ones in the XFDU Blue Book. Finally, the manifest document was named “xfdumanifest.xml” according to the convention introduced in 2003 by IPR working group. This convention is stated in the XFDU structure and construction rules recommendation and the ESA software had to be updated to recognize the manifest file automatically within the ZIP archive.

Figure B-3: XFDU View of the NASA Regression package

B4 NASA PDS MGST Package

The following XFDU package has been generated by NASA during JPL/XFDU testing from MGS Thermal Emission Spectrometer Data.

B4.1 Package Layout

The package is a ZIP file of more than 400Mb that contains nested content units referencing a large number of Metadata and Data Objects.

B4.2 Manifest File (Abstract)

The following sample has been voluntarily truncated to reduce the page number.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>

CCSDS REPORT CONCERNING XFDU INTEROPERABILITY TESTING

Data Set Overview

The TES-TSDR data product contains the raw and calibrated thermal IR radiance spectra, the visual and thermal bolometric radiance measurements, and several atmospheric and surface properties derived from this data. Also included are the parameters that describe each observations, some downlinked diagnostic information, and the pointing and positional information derived from the project's SPICE kernels.

The TES data is divided into 10 tables (OBS, RAD, BOL, GEO, POS, TLM, IFG, CMP, ATM, LMB). Each table is stored in a separate file as a PDS TABLE structure, using fixed-length binary records, with extensions to handle the variable length spectra. Every record is stored with the spacecraft time, and related records can be retrieved from each table using time as a common key. In some tables, up to 6 records can be stored for a given time, one for each detector. In these cases the records also include a field named 'detector', which with the time field, uniquely identifies the record.

The data products on this volume may be reprocessed at the end of the mission.

Modification History

Version 1 data volumes include MGST_0001 through MGST_0226, released between June 1999 and October 2001. These volumes contain TES data collected August 1997 through March 2001.

The version 2 data set release began January 2002; version 2 supersedes version 1. The version 2 release is necessitated by several improvements that the TES Team has made to the version 1 data set throughout the mapping phase of the MGS mission. The most significant of these improvements include:

- MGST_0100 (Oct 1999) - classification and quality fields added to the OBS and RAD tables;
- MGST_0162 (Oct 2000) - thermal inertia fields added to the BOL and RAD tables;
- MGST_0188 (Apr 2001) - ATM table replaces SRF table and is filled with atmospheric products;
- MGST_0213 (Oct 2001) - geometry and position fields are calculated using new calibration software (V003a).

Since previously released volumes were not re-released with each improvement, incompatibility problems developed between data volumes released at different times. The version 2 data release incorporates all of the above changes and is a uniform collection of all available TES mapping data.

Data

====

Each table is stored in a PDS TABLE structure using fixed-length binary records sorted time-sequentially. Each table file is prefixed with an ASCII header that describes the contents and format of the table, and a pointer that indicates where the binary table data starts. The description identifies each column in the table, detailing its name, starting position (in bytes), size (in bytes), data type, description and scaling

CCSDS REPORT CONCERNING XFDU INTEROPERABILITY TESTING

factors if applicable. In some cases the column being described is a fixed-length array of related, homogeneous values, in which case the column description also includes the number of items in the array, and the size of each item.

Four tables (RAD, ATM, CMP, IFG) store variable length data. These variable length records are stored in a file separate from the fixed length records, and are addressed from the fixed-length records with a pointer column. Pointer columns contain the position of the variable length data, in bytes, from the start of the file it is in.

Fixed-length records are stored in files with a .DAT extension. The variable length records that are referenced by an individual .DAT file are found in a file with the same name, but with a .VAR extension.

Coordinate System

=====

Mars areocentric, west positive

Software

=====

The TES project has produced a software tool that not only reads the PDS table and variable length records, but is also capable of joining the related records among multiple tables. This piece of software is called 'vanilla', and is provided on this cd.

'Vanilla' is also available via anonymous ftp from <ftp://east.la.asu.edu/pub/software/vanilla/vanilla.tar.Z>. The vanilla program works on UNIX machines with integers in MSB_INTEGER format and on PC platforms.

B4.3 ESA Interoperability Test Report

The package has been submitted to the ESA implementation further a mirror change of namespace. Actually, the submitted package was also referencing the <http://www.ccsds.org/xfdu/2004> namespace that is considered obsolete by the ESA implementation and that, in the last version of the software, is used to segregating former or progress XFDU construction rules from the recommended ones in the XFDU Blue Book. Finally, the manifest document was named “xfdumanifest.xml” according to the convention introduced in 2003 by IPR working group. This convention is stated in the XFDU structure

and construction rules recommendation and the ESA software had to be updated to recognize the manifest file automatically within the ZIP archive.

```

This report shows that ESA Implementation successfully browsed the Manifest file i.e. without failure, and demonstrates the interoperability of the XFDU concepts: goals of the testing activity.

B4.4 CNES Interoperability Test Report

The following figure reports that XFDU View was able to ingest the XFDU package and interpret its content. Here, the left tree shows the “extension” entries that demonstrate the ability to handle these elements without failing.

CCSDS REPORT CONCERNING XFDU INTEROPERABILITY TESTING

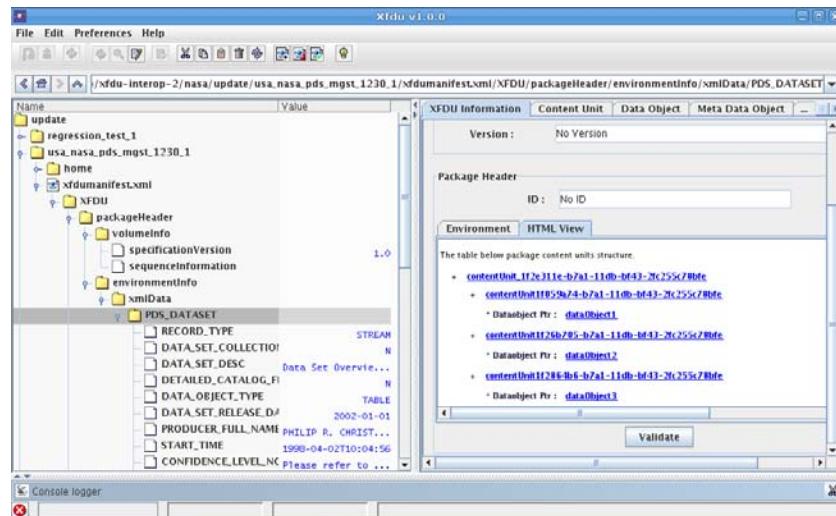

Figure B-4: XFDU View of the NASA/MGST package

ANNEX C**CNES SW OUTPUTS - AGENCIES TEST REPORTS****C1 Referenced Data Object - Package**

The following package has been generated by CNES for testing references to external file location from Metadata and/or Data Objects.

C1.1 Package Layout

The package is composed of a single Manifest file named “listing01.xml” and that contains referenced file location to external URL

C1.2 Manifest File (Abstract)

```
<?xml version="1.0" encoding="UTF-8"?>
<xfdt:XFDU xmlns:xfdu="urn:ccsds:schema:xfdu:1">
<informationPackageMap>
  <xfdu:contentUnit ID="singleContent" textInfo="This is a single content unit">
    <dataObjectPointer dataObjectID="myData"/>
  </xfdu:contentUnit>
</informationPackageMap>
<dataObjectSection>
  <dataObject ID="myData">
    <byteStream>
      <fileLocation href="test.data" locatorType="OTHER"/>
    </byteStream>
  </dataObject>
</dataObjectSection>
</xfdu:XFDU>
```

[INFO ] The input package is valid.
```

This report shows that ESA Implementation successfully browsed the Manifest file i.e. without failure, and demonstrates the interoperability of the XFDU concepts: goals of the testing activity.

C1.4 NASA Interoperability Test Report

The NASA software was able to parse the files, reconstruct the manifest elements as Java objects and rewrite the manifest to the disk.

C2 Wrapped XML Data - Package

The following package has been generated by CNES for testing wraps around of xml data defined in a different namespace.

C2.1 Package Layout

The package is composed of a single Manifest file named “listing01.xml” and file contains wrapped XML data from another namespace.

C2.2 Manifest File (Abstract)

```
<?xml version="1.0" encoding="UTF-8"?>
<xfdu:XFDU xmlns:xfdu="urn:ccsds:schema:xfdu:1">
  <informationPackageMap>
    <xfdu:contentUnit ID="XMLContent" textInfo="This is embedded XML Data">
      <dataObjectPointer dataObjectID="myXmlData"/>
```

```

</xfdu:contentUnit>
</informationPackageMap>

This report shows that ESA Implementation successfully browsed the Manifest file i.e. without failure, and demonstrates the interoperability of the XFDU concepts: goals of the testing activity.

C4.4 NASA Interoperability Test Report

The NASA software was able to parse the files, reconstruct the manifest elements as Java objects and rewrite the manifest to the disk.

ANNEX D**TESTS ON ERROR HANDLING****D1 PACKAGEHEADER ERROR TESTING**

This test was motivated by the fact the the ESA test reports did not include any information on the correct packageHeaders due to the SAFE API standard validation reports.

The following errors were introduced;

- The specificationVersion element was removed
- The sequencePosition attribute was removed

D1.1 ORIGINAL NASA PACKAGEHEADER

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<xfd:XFDU xmlns:sip="sip" xmlns:dip="dip"
  xmlns:xfdu="urn:ccsds:schema:xfdu:1"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="urn:ccsds:schema:xfdu:1 /home/sergey/jbproject/xfdu.
  jxb2/schema/xfdu.xsd sip sipcommon1.xsd">
  <packageHeader ID="ph">
    <volumeInfo>
      <specificationVersion>1.0</specificationVersion>
      <!-- sip sequence information is accomodated by XFDU

D1.4 NASA REPORT

cvc-complex-type.2.4.a: Invalid content was found starting with element 'sequenceInformation'. One of '{specificationVersion}' is expected. @see: <http://www.w3.org/TR/xmlschema-1/#cvc-complex-type>

cvc-complex-type.4: Attribute 'sequencePosition' must appear on element 'sequenceInformation'. @see: <http://www.w3.org/TR/xmlschema-1/#cvc-complex-type>

D2 NASA ERROR INSTANCE

This test was to better illustrate the linkages between data objects and content units. The JPL XFDU from Annex B4 was used as the basis for this test.

The following errors were introduced;

- The dataObjectID="dataObject194" was removed from the dataObjectPointer in the first content unit (ID = contentUnit0235f609-ba46-11dc-95da-15747182e6c1)
- The ID attribute In the second data object (ID was dataObject195) was removed
- The checksum Iin the last dataObject (ID=dataObject196,) was modified from f5bec905 to f5bec906.

D2.4 NASA TEST REPORT

cvc-complex-type.4: Attribute 'dataObjectID' must appear on element 'dataObjectPointer'.
 @see: <http://www.w3.org/TR/xmlschema-1/#cvc-complex-type>

cvc-complex-type.4: Attribute 'ID' must appear on element 'dataObject'.
 @see: <http://www.w3.org/TR/xmlschema-1/#cvc-complex-type>

cvc-id.1: There is no ID/IDREF binding for IDREF 'dataObject195'.
 @see: <http://www.w3.org/TR/xmlschema-1/#cvc-id>

Checksum check failed at Data object: dataObject196

D3 ESA INSTANCE WITH ERRORS

The changes regarding the previously sent sample may be summarized as follow:

- a) The @dataObjectPointer attribute of a Content Unit has been removed
- b) An @ID attribute has been removed from the first Metadata Object
- c) The Checksum of the first Data Object has been corrupted i.e. becomes "falsesum"

Checksum check failed at Data object: measurementData

D4 RECONSTITUTION OF ORIGINAL XFDU

This test was inspired by the ESA reports in the ESA Interoperability reports shown in the previous Annexes. The ESA tests cases were completely reconstituted: however many changes occurred in term of attribute orders and formatting, the output Manifest document remained valid.

D4.1 ESA MERIS ORIGINAL SCHEMA

D4.3 OBERVATIONS

The NASA XFDU toolkit reconstituted SAFE instance contained all the XML elements and attributes from the original SAFE instance. The differences included

- No comments were reconstituted
- Order of attributes was not mantained
- The elements of namespaces not known to the XFDU Toolkit (GML and SAFE) were not included in the namespace declaration of the root node but in each top level foreign elements wrapped around;

These differences do not affect the information content of an XML instance so the input and output Manifest are equivalent

ANNEX E

EARLY TEST RESULTS ERRORS DUE TO SCHEMA INCONSISTENCIES

E1 ESA TEST RESULT OF NASA INSTANCE WITH INCORRECT SCHEMA VERSION
